

Social Media (Bar Chart): Grade 9

A. Title of card: Bar Charts illustrating time spent on different social media
B. Competency, Element and Performance Criteria: C 2.4: Represent and interpret data from charts/graphs in daily life Element 1: Read and interpret bar charts, line graphs and pie charts Performance Criteria: Bar charts - Level 1: Construct Bar charts & Level 2: Read and interpret data represented in bar charts
C. Purpose of activity: This activity will develop students' understanding of bar charts as well as enable them to represent and interpret data from these charts in daily life.
D. Learning Outcomes: By the end of the lesson, students should be able to: • Identify the different components in a bar chart (e.g., title, axes, labels, bars). • Construct a bar chart using a given set of data. • Read and interpret data represented in a bar chart.
E. Resources and materials: • Coloured whiteboard markers • Graph paper • Coloured pencils
F. Teaching trajectories/Implementation guidelines: Activity 1: How much time do you spend on social media? Steps: 1. Ask the students in your class to state the approximate number of hours they spend daily on social media. E.g., 0 - 1 hr; 1 - 2 hrs; 2 - 3 hrs; 3 - 4 hrs; 4+ (more than 4) hrs. 2. Record their responses on the board in tabular form. 3. Demonstration - Use the data collected to draw a simple bar chart on the board, using different colours for the different bars. Show the students how to label the axes and choose an appropriate scale.

4. Highlight the key points:

- **What is a bar chart?**

A visual representation of data using rectangular bars. Bar charts are drawn for categorical data i.e. data that are divided into different categories.

- **Parts of a bar chart:**

- Title: e.g. Time Spent on Social Media by Grade 9 Students
- Horizontal - axis: Time/number of hours spent (categories)
- Vertical-axis: Number of students
- Labels and scale

Activity 2 – Favourite Social Media Platforms

5. A survey is carried out with the students to collect data on their 'Most Used/Favourite Social Media Platform'.
6. In pairs, students construct a bar chart using graph paper or digital/online tools (if available). The teacher assists struggling students.
7. Students are asked about the use of bar charts in real-life social media analytics; E.g., Tracking influencers' the number of followers.

G. Assessment

Question 1. Interpreting Bar Chart

Study the bar chart below which illustrates the 'Weekly Time spent (in hours) on different Social Media Applications (Apps)' and answer the following questions:

- (a) Which 'app' is used the most during the week?

- (b) Which 'app' is used the least during the week?
- (c) What is the difference in the number of hours spent between the most and the least used apps during the week?

Note: The above questions may be assessed orally.

Question 2. Constructing a Bar Chart

The table below shows the favourite social media applications among 36 students.

Social Media Platform	Instagram	TikTok	Facebook	WhatsApp
Number of students	13	11	5	7

- (a) Use the information given and construct a bar chart on graph paper.
Remember: Include a title and label the axes of the bar chart.

Questions for discussion.

- (b) What does the height of each bar represent?

(c) Why is labelling important in a bar chart?

Question 3. Collecting data and Constructing a Bar Chart

Ask your students to identify 4 influencers/popular figures.

(a) Draw a table to show the number of followers for each social media platform identified; e.g. TikTok or Instagram.

(b) From the data obtained, construct a bar chart on graph paper.

(c) Interpret the different components of the bar chart. Ask questions such as: Which influencer is most/least followed? What is the difference between the most and the least number of followers?

H. Extension of activity

Represent the data in Question 2 using a *pie chart*.

Discuss the construction, representation and interpretation of data using a pie chart in other practical situations.
